(574) 360 7720 | Fort Wayne, IN
Portfolio

Senior machine learning engineer with 5+ years of experience building complex systems. Builds stakeholder-centered solutions spanning fraud detection, forecasting, classification, and retrieval-backed products with real-time inference.

MACHINE LEARNING & ENGINEERING SKILLS

Machine Learning: Retrieval systems, model serving, feature engineering, LightGBM, scikit-learn, PyTorch, RAG, agentic workflows

Backend & Infra: Microservices, GCP, Kubernetes, Kafka, Google Pub/Sub, Docker, DataDog, React, Flutter

Data Platforms: BigQuery, Postgres, PGVector, Neo4j, Redis, MySQL, MongoDB, Firestore, SQLite

Core Languages: Python, Go, TypeScript, JavaScript, C#, Dart

AI-Assisted Development: Claude, Cursor, GitHub Copilot for accelerated research, prototyping, and implementation

PROFESSIONAL EXPERIENCE

Sweetwater — May 2021 - Present

Senior Machine Learning Engineer (May 2026 – Present)

- **ML Engineering Leadership & Delivery:** Lead ML engineering initiatives by planning projects, establishing baselines, architecting production solutions, and guiding engineers through productionizing simple and complex models.
- **Real-Time Fraud Detection Modernization (In Progress):** Built the stakeholder-approved batch fraud model, achieving 85% precision with high recall; now extending it to real-time inference, projected to identify an additional $100K per month in fraud.
- **Residual Demand Forecasting (In Progress):** Building a model that predicts residuals from an established demand forecasting system, using familiar baseline outputs to support stakeholder validation, trust, and adoption.
- **Stakeholder-Centered Model Strategy:** Partner with cross-functional stakeholders to translate complex business needs into technical solutions; present and recommend approaches ranging from linear regression and LightGBM to neural networks and pretrained transformers.

Senior Backend Software Engineer (2025 - May 2026)

- **Customer Deduplication ML & Inference Platform:** Designed and productionized a customer deduplication system using Siamese embeddings, pairwise scoring, and Neo4j/PGVector retrieval, reducing noisy duplicate records by 80% in real-time inference workflows across Python and Go services.
- **Customer Classification Model & Serving:** Developed a customer classification model from multi-touch behavioral signals and architected the real-time infrastructure required to serve predictions at scale inside downstream sales workflows.
- **Embedded Customer Intelligence Platform:** Built a real-time, event-driven Go/Postgres service that pushed customer insights from our web data platform into a legacy CRM through dynamic lists, actions, and background workflows, making new intelligence easy to operationalize.

Software Engineer (May 2021 - 2025)

- **Matchmaking & Customer Intelligence:** Helped build an asynchronous Go-based service pairing thousands of customers daily with sales representatives.
- **Analytics Platform Rewrite:** Modernized legacy analytics APIs in Go into a more dynamic service architecture, reducing friction for adding new tracked events and scaling downstream reporting use cases.
- **Sales Continuity Workflows:** Delivered backup note-entry workflows in the toolsite that let sales continue working during CRM outages, proving especially critical during high-volume periods like Black Friday.

EDUCATION

Georgia Tech | *M.S. Machine Learning* — 2026 - 2028

Purdue Fort Wayne | *B.S. Computer Science* — 2021

Graduated in 3 years • GPA: 3.67

SELECTED INDEPENDENT PROJECTS

- **Paper Prayer:** Built a retrieval-augmented recommendation system using Python, RAG, and PGVector to match prayer requests and study-group needs with relevant content, exposed through Flutter/React clients.
- **Study Forge AI:** Built a study platform that turns notes into structured knowledge components, uses agentic orchestration and tool-enabled chat to generate adaptive quizzes.
